

ISO/IEC 27001 certified

Bring us in when a bank's AI is stuck at pilot.

CoderPush turns bank AI pilots into production workloads on AWS, in Vietnamese, with the data kept in Vietnam.

Quick desktop went GA on 9 Sep and the Hanoi Local Zone opened in June. We make both safe for banks.

Share an opportunity →

● Live at TPS since April 2026 ● Presight PoC at MB Bank ● Handed over at TPBank

When to bring us in

✔ A GenAI pilot works in a demo but has not reached production.

✔ The use case needs Vietnamese speech or documents.

✔ Data must stay in Vietnam.

✔ The bank wants Quick but worries about where its data goes.

✔ AI Law or SBV deadlines are forcing an inventory of AI systems.

✔ IT wants AI-native engineering with Kiro, as TPBank did.

AI is everywhere in Vietnamese finance. Production is not.

41%

of Vietnamese financial services firms actively deploy AI

61%

of Vietnamese businesses using AI are still in testing

8%

of Vietnamese businesses run AI agents in core processes

The hard part is no longer the model. It is Vietnamese data, governance and the path to go-live.

Unlocking Vietnam's AI Potential 2026, AWS and Strand Partners.

The rules have arrived. Build to them from day one.

- The AI Law applies now.

Every system we ship carries its evidence: risk class, logs, human override and a kill switch.

A summary for orientation, not legal advice.

Buy the front end. Build the brain. Keep the data.

Your people work in Amazon Quick or your own apps. We build the intelligence in the middle: Vietnamese speech, documents and agents. Your data stays where it lives today.

Where must your data live?

☐ AWS Region

☒ Hanoi Local Zone

Compute and storage inside Vietnam, managed through the same AWS APIs.

Business users see Quick; the brain and the data stay with the bank

Example flow: every contact-centre call becomes insight and a next action

----- Below: personal data stays in Vietnam

Experience: we configure

Amazon Quick

Dashboards and chat for managers
de-identified aggregates only

CRM and bank apps

Next-best action for RMs and
contact-centre agents

 Identity and access

 Audit logs

 Human override

 Kill switch

☒ Evals gate releases

☒ AI Law evidence pack

Nine use cases, each built to run on AWS.

One pattern every time: the bank's data stays in Vietnam, the intelligence runs on AWS, and people work with the result in Amazon Quick or the bank's own apps.

Contact-centre intelligence in Quick

Every recorded call is transcribed in Vietnamese on AWS and tagged for intent, complaints, compliance risk and sales signals. Managers work with the result in Quick desktop, as dashboards and chat.

On AWS
Speech to text in the Hanoi Local Zone; tagging agents on Amazon Bedrock, on de-identified transcripts; Amazon Quick as the front end

KPI
Share of calls reviewed; complaint resolution time

Proof
Our Vietnamese language research; live demo

Sales-call compliance for insurance and investment products

Every recorded sales conversation is checked against the required disclosures and the approved script. Compliance reviews the exceptions in Quick, not a sample of calls.

On AWS
Speech to text in the Hanoi Local Zone; checking agents on Amazon Bedrock; exceptions in Amazon Quick

KPI
Share of sales calls checked; issues found before a complaint

RM assistant and next-best action

A brief before every client meeting and the next best product, inside the CRM

On AWS
Customer data platform on AWS; briefs written on Amazon Bedrock; delivered inside the bank's CRM

KPI
Products per client

Proof
TPS Customer Data Platform: under 5 minutes from event to CRM

Credit memo from financial statements

Vietnamese statements read, checked and drafted into a first credit memo

On AWS
Statements in Amazon S3; reading, checks and drafting on Amazon Bedrock

KPI
Time to credit decision

Proof
Our Vietnamese financial data engine (Promvis)

Policy and product answers for branch staff

Staff ask in Vietnamese about products, policies and procedures. Every answer cites its source page and comes only from documents the bank has approved.

On AWS
Documents in Amazon S3; Amazon Bedrock Knowledge Bases; chat in Amazon Quick

KPI
Time to answer a policy question; calls to the internal help desk

Governed analytics for business users

Plain-language questions answered only from certified metrics

On AWS
Certified metrics over the bank's data platform; questions answered on Amazon Bedrock; Amazon Quick as the front end

KPI
Questions answered without an analyst ticket

Proof
Presight PoC at MB Bank

Investment assistant for securities and wealth arms

An AI analyst inside the trading app, with insight on each ticker before the user asks

On AWS

Runs in the firm's own AWS account. T'FOX was TPS's first workload on AWS

KPI

Returning users; share of questions answered in full

Proof

T'FOX at TPS, live since April 2026; the next one goes live in 3-4 weeks

AI system inventory and evidence pack for the AI Law

Every AI system the bank runs is listed with its risk class, logs, human override and kill switch, and the evidence stays current between audits.

On AWS

Logs from AWS CloudTrail and Amazon CloudWatch; Amazon Bedrock Guardrails; the inventory in Amazon Quick

KPI

AI systems inventoried and classified; time to answer a regulator's request

Proof

Every system we ship carries its evidence pack

AI-native engineering for bank IT, with Kiro

The bank's engineers build from specifications with AI agents, and a named engineer reviews every change. We work alongside the team, then hand the method over.

On AWS

Kiro for specification-driven development, in the bank's own repositories

KPI

Lead time from specification to release

Proof

TPBank: the bank's own team now runs the method without us

Systems in production, measured.

● Live

T'FOX, AI investing assistant

TPS

Live since 10 Apr 2026 · 175 days in production

72% of questions in scope; 48% of users return and drive 81% of traffic; every question traced across 31 intent classes.

Reference available

● Live

Customer Data Platform on AWS

TPS

Under 5 minutes from event to CRM; every active client resolved to one profile.

● Delivered

Agent-driven development, handed over

TPBank

The bank's own team now runs the method without us.

PoC completed

Presight, governed AI analytics

 MB Bank

PoC completed successfully; v2 in build

Natural-language answers on governed metrics. Built by our Head of AI Applications, delivered exclusively by CoderPush in Vietnam.

Reference available

Live

AI ordering assistant

 BuyMed

35,000+ pharmacies and clinics; 40% faster order processing.

Delivered

Deepfake detection on the phone

 Ensign, Singapore

MVP in 8 weeks; under 500 ms per check on a mid-range phone.

Evidence before go-live. Measurement after.

01

Spec first.

The specification is the contract, written for people and for models.

02

Evaluate before launch.

A test set built from your real data; nothing ships without passing it.

03

Humans hold the go/no-go.

Our engineers own architecture, review and release; nothing merges unattended.

04

Evidence by default.

Risk class, logs, human override and a kill switch, ready for your risk team and the regulator.

Every month you get a report like the one we send TPS: every question traced and classified, what worked, what did not, and what we fix next.

What we are not

Not a large-scale server migration factory, and not a licence reseller that disappears after the sale.

What the account gains

T'FOX was TPS's first workload on AWS. Every new use case we ship on AWS is shared in ACE, and we handle the funding paperwork.

The people you will work with.

Harley Trung

Co-founder & Chief AI Officer

Sets how we build, evaluate and govern every AI system we ship. Yale Computer Science; Microsoft; founder of startups in the US and China.

Ben Pham

Head of AI Applications

Turns bank data into answers business users can trust. Founder of presight.io; former Chief Data Officer, Siêu Việt Group; former Data Scientist, Microsoft.

Dr. Andy Tran

Head of AI Research

Leads our work on Vietnamese language and document AI. PhD, Kanazawa University; built Doctranslate.io; former CTO at Logivan and Waves8; lecturer, VNU International School.

- Thien Tran, Tech Lead, T'FOX
- Thien Kieu, Technical Manager, bank AI programmes
- Cang Ta, AWS Practice Manager

How to engage

- Share the opportunity in ACE, or [email us](#) with the bank and the use case.
- Your contact: Cang Ta, AWS Practice Manager.

Five first-call questions

1. Which AI use case has a sponsor and a KPI but no path to production?
2. Where must the data live: an AWS Region or Vietnam only?
3. Is Vietnamese speech or document handling involved?
4. Who signs off AI risk today, and have they mapped the AI Law deadlines?
5. Is there budget this quarter, or should we apply for AWS funding first?

What the bank will ask, and how we answer.

Where does our data live?

Where you decide: an AWS Region or the Hanoi Local Zone. Personal data is de-identified before anything leaves your perimeter.

Who owns the code and the accounts?

You do. We build in your AWS accounts under your IAM, and you can revoke our access at any time.

How do you contract?

As a consulting services engagement: a scoped project, or a fee linked to an agreed outcome.

Can AWS help fund it?

For eligible projects, we apply for AWS funding on your behalf and handle the paperwork.

How fast can we go live?

A new use case goes live for a named user group within one quarter. Where our product already exists it is faster: an investment assistant like T'FOX goes live in 3-4 weeks.

[Book a 30-minute intro →](#)

How do you pass our security review?

We are ISO/IEC 27001 certified. We work inside your AWS accounts, under your access policies, with every action logged, and our due-diligence pack includes the certificate and its scope.
